

Technician dispatch standard

DISPATCH STANDARD

OPS-DISPATCH-004

Owner: Dispatch Lead | Effective: 15 July 2026 | Availability data is operational and may change during a shift.

Purpose

This standard governs the final selection made before an on-site work order is created. It deliberately separates recommendation from dispatch: a coordinator can prepare a likely match, but the final write must use current qualification and availability evidence.

Qualification and availability

A technician may be dispatched only when their skills and current certifications match the asset and work required.

Availability must be checked again immediately before work-order creation. If no suitable technician is available, the request stays with dispatch for a human decision rather than being assigned to the closest person automatically.

Dispatch record

- Record the selected technician, the matching skill and the availability check.
- Keep the request with dispatch when qualification or availability is uncertain.
- Do not substitute a nearby technician who lacks the required skill or certification.

Selection sequence

- Confirm the asset type and the certification requirements stored on the asset record.
- Filter for the required skill, then require every listed certification.
- Check current availability and active assignments immediately before creation.
- Keep distance as a tie-breaker after qualification, not as a substitute for it.

No suitable resource

If nobody qualified is available, retain the request with dispatch and escalate the resource decision. Do not create a placeholder work order against an unavailable or unqualified technician. The dispatch lead may reprioritise another job or engage a partner, but that is a human decision.

Changes after assignment

If availability changes after assignment but before acknowledgement, reopen selection and preserve the earlier attempt. If the technician is already en route, use the dispatch change process rather than silently overwriting the work order.

Shared by Northstar Field Services for this engagement.
